

Continuing Education Outreach Program

CCMC: **Approved for 1.0 hour**

CombiMatrix is a clinical diagnostic laboratory specializing in cytogenomic testing for prenatal diagnosis, miscarriage analysis, and pediatric developmental disorders. Our passion is chromosomal microarray analysis, but we also are a full-scale cytogenetic laboratory, offering aneuploidy FISH, standard and customized FISH, and karyotyping.

At CombiMatrix, we pride ourselves on the clinical and molecular diagnostic expertise of our medical team, and on the technical expertise of our scientists and laboratory technicians. As an industry leader in microarray analysis, we are committed to providing ongoing clinical educational opportunities to support our healthcare partners.

We have developed a Continuing Education (CE) Program regarding recurrent pregnancy loss which has been designed specifically with professional case managers in mind. We would love to have the opportunity to come present to you at your facility.

Recurrent Pregnancy Loss – Improved Case Management Through Effective Diagnosis

This session provides information on how appropriate diagnostic testing can improve patient case management, assist clinicians in making successful treatment decision, and provide more cost-effective management of recurrent pregnancy loss (RPL) by reducing unnecessary testing and sub-specialty utilization.

Topics include:

- Defining the unmet clinical need in RPL management and why better genetic testing is needed
- The clinical importance of miscarriage analysis for recurrent pregnancy loss
- Understanding the difference between traditional karyotyping vs. chromosomal microarray analysis for evaluation of early pregnancy losses/Products of Conception (POCs)
- Recognizing how the overall diagnostic process aides in the appropriate assessment of why/how the miscarriage occurred and enables the clinician to make more successful decisions for the patient's reproductive care
- Clinical pathways for effective patient case management and understanding how clinicians can be empowered with the proper diagnostic testing guidance to avoid unnecessary testing and subspecialty utilization
